

# Querying Semantic Web Data with SPARQL (and SPARQL 1.1)

Marcelo Arenas

PUC Chile

“The Semantic Web is an extension of the current web in which information is given well-defined meaning, better enabling computers and people to work in cooperation.”

[Tim Berners-Lee et al. 2001.]

Specific goals:

- ▶ Build a description language with standard semantics
  - ▶ Make semantics machine-processable and understandable
- ▶ Incorporate logical infrastructure to reason about resources
- ▶ W3C proposals: **Resource Description Framework (RDF) and SPARQL**

# An example of an RDF graph: DBLP

```

conf: <http://dblp.l3s.de/d2r/resource/conferences/>
inPods: <http://dblp.l3s.de/d2r/resource/publications/conf/pods/>
swrc: <http://swrc.ontoware.org/ontology#>
dc: <http://purl.org/dc/elements/1.1/>
dct: <http://purl.org/dc/terms/>

```

# Querying RDF: SPARQL

- ▶ SPARQL is the W3C recommendation query language for RDF (January 2008).
  - ▶ SPARQL is a recursive acronym that stands for *SPARQL Protocol and RDF Query Language*
- ▶ SPARQL is a graph-matching query language.
- ▶ A SPARQL query consists of three parts:
  - ▶ Pattern matching: optional, union, filtering, ...
  - ▶ Solution modifiers: projection, distinct, order, limit, offset, ...
  - ▶ Output part: construction of new triples, ....

# SPARQL in a nutshell

# SPARQL in a nutshell

```

# RDF formal model

- I** : set of IRIs
- B** : set of blank nodes
- L** : set of literals

# RDF formal model

- I** : set of IRIs
- B** : set of blank nodes
- L** : set of literals

$(s, p, o) \in (\mathbf{I} \cup \mathbf{B}) \times \mathbf{I} \times (\mathbf{I} \cup \mathbf{B} \cup \mathbf{L})$  is called an **RDF triple**

# RDF formal model

- I** : set of IRIs
- B** : set of blank nodes
- L** : set of literals

$(s, p, o) \in (\mathbf{I} \cup \mathbf{B}) \times \mathbf{I} \times (\mathbf{I} \cup \mathbf{B} \cup \mathbf{L})$  is called an **RDF triple**

A finite set of RDF triples is called an **RDF graph**

## Proviso

- ▶ We do not consider blank nodes in RDF graphs
  - ▶  $(s, p, o) \in \mathbf{I} \times \mathbf{I} \times (\mathbf{I} \cup \mathbf{L})$  is called an RDF triple
- ▶ We consider blank nodes in queries
  - ▶ Each blank node is assumed to start with  $\_$ , for example  $\_:b$  and  $\_:b_1$

# SPARQL: An algebraic syntax

**V**: set of variables

- ▶ Each variable is assumed to start with ?

**Triple pattern:**  $t \in (\mathbf{I} \cup \mathbf{B} \cup \mathbf{V}) \times (\mathbf{I} \cup \mathbf{V}) \times (\mathbf{I} \cup \mathbf{B} \cup \mathbf{L} \cup \mathbf{V})$

- ▶ Examples:  $(?X, \text{name}, \text{john})$ ,  $(?X, \text{name}, ?Y)$ ,  $(?X, \text{name}, \_ : b)$

**Basic graph pattern (bgp):** Finite set of triple patterns

- ▶ Examples:  $\{(?X, \text{knows}, ?Y), (?Y, \text{name}, \text{john})\}$ ,  
 $\{(?X, \text{knows}, \_ : b), (\_ : b, \text{name}, \text{john})\}$

# SPARQL: An algebraic syntax (cont'd)

Recursive definition of SPARQL graph patterns:

- ▶ Every basic graph pattern is a graph pattern
- ▶ If  $P_1, P_2$  are graph patterns, then  $(P_1 \text{ AND } P_2)$ ,  $(P_1 \text{ OPT } P_2)$ ,  $(P_1 \text{ UNION } P_2)$  are graph pattern
- ▶ If  $P$  is a graph pattern and  $R$  is a *built-in condition*, then  $(P \text{ FILTER } R)$  is a graph pattern

SPARQL query:

- ▶ If  $P$  is a graph pattern and  $W$  is a finite set of variables, then  $(\text{SELECT } W \text{ } P)$  is a SPARQL query

# Mappings: building block for the semantics

## Definition

A mapping is a partial function:

$$\mu : \mathbf{V} \longrightarrow (\mathbf{I} \cup \mathbf{L})$$

The evaluation of a graph pattern results in a set of mappings.

# Mappings: building block for the semantics

## Definition

A mapping is a partial function:

$$\mu : \mathbf{V} \longrightarrow (\mathbf{I} \cup \mathbf{L})$$

The evaluation of a graph pattern results in a set of mappings.

# Semantics of SPARQL: Basic graph patterns

Additional notation:  $\sigma : \mathbf{B} \rightarrow (\mathbf{I} \cup \mathbf{L})$  is an instance mapping.

# Semantics of SPARQL: Basic graph patterns

Additional notation:  $\sigma : \mathbf{B} \rightarrow (\mathbf{I} \cup \mathbf{L})$  is an instance mapping.

Let  $P$  be a basic graph pattern

- ▶  $\text{var}(P)$ : set of variables mentioned in  $P$

## Definition

The evaluation of  $P$  over an RDF graph  $G$ , denoted by  $\llbracket P \rrbracket_G$ , is the set of mappings  $\mu$ :

- ▶  $\text{dom}(\mu) = \text{var}(P)$
- ▶ there exists an instance mapping  $\sigma$  such that  $\mu(\sigma(P)) \subseteq G$

# Outline of the talk

- ▶ RDF and SPARQL
- ▶ New features in SPARQL 1.1
  - ▶ Entailment regimes for RDFS and OWL
  - ▶ Navigational capabilities: Property paths
  - ▶ An operator to distribute the execution of a query
- ▶ Take-home message

# SPARQL 1.1

A new version of SPARQL was released in March 2013:  
SPARQL 1.1

Some new features in SPARQL 1.1:

- ▶ Entailment regimes for RDFS and OWL
- ▶ Navigational capabilities: Property paths
- ▶ An operator (SERVICE) to distribute the execution of a query

Also in this version: Nesting of SELECT expressions, aggregates and some forms of negation (NOT EXISTS, MINUS)

# Outline of the talk

- ▶ RDF and SPARQL
- ▶ New features in SPARQL 1.1
  - ▶ Entailment regimes for RDFS and OWL
  - ▶ Navigational capabilities: Property paths
  - ▶ An operator to distribute the execution of a query
- ▶ Take-home message

# Syntax of RDFS

RDFS extends RDF with a schema vocabulary: `subPropertyOf` (`rdfs:sp`), `subClassOf` (`rdfs:sc`), `domain` (`rdfs:dom`), `range` (`rdfs:range`), `type` (`rdfs:type`).

# Syntax of RDFS

RDFS extends RDF with a schema vocabulary: `subPropertyOf` (`rdfs:sp`), `subClassOf` (`rdfs:sc`), `domain` (`rdfs:dom`), `range` (`rdfs:range`), `type` (`rdfs:type`).

How do we evaluate a query over RDFS data?

# A simple SPARQL query: (Messi, rdfs:type, person)

Checking whether a triple  $t$  is in a graph  $G$  is the basic step when answering queries over RDF.

- ▶ For the case of RDFS, we need to check whether  $t$  is implied by  $G$

The notion of entailment in RDFS can be defined as for first-order logic.

This notion can also be characterized by a set of inference rules.

# An inference system for RDFS

Sub-property : 
$$\frac{(\mathcal{A}, \text{rdfs:sp}, \mathcal{B}) (\mathcal{B}, \text{rdfs:sp}, \mathcal{C})}{(\mathcal{A}, \text{rdfs:sp}, \mathcal{C})}$$

$$\frac{(\mathcal{A}, \text{rdfs:sp}, \mathcal{B}) (\mathcal{X}, \mathcal{A}, \mathcal{Y})}{(\mathcal{X}, \mathcal{B}, \mathcal{Y})}$$

Subclass : 
$$\frac{(\mathcal{A}, \text{rdfs:sc}, \mathcal{B}) (\mathcal{B}, \text{rdfs:sc}, \mathcal{C})}{(\mathcal{A}, \text{rdfs:sc}, \mathcal{C})}$$

$$\frac{(\mathcal{A}, \text{rdfs:sc}, \mathcal{B}) (\mathcal{X}, \text{rdfs:type}, \mathcal{A})}{(\mathcal{X}, \text{rdfs:type}, \mathcal{B})}$$

Typing : 
$$\frac{(\mathcal{A}, \text{rdfs:dom}, \mathcal{B}) (\mathcal{X}, \mathcal{A}, \mathcal{Y})}{(\mathcal{X}, \text{rdfs:type}, \mathcal{B})}$$

$$\frac{(\mathcal{A}, \text{rdfs:range}, \mathcal{B}) (\mathcal{X}, \mathcal{A}, \mathcal{Y})}{(\mathcal{Y}, \text{rdfs:type}, \mathcal{B})}$$

## Theorem (H03,MPG09,GHM11)

*The previous system of inference rules characterize the notion of entailment in RDFS (without blank nodes).*

Thus, a triple  $t$  can be deduced from an RDF graph  $G$  ( $G \models t$ ) iff  $t$  can be deduced from  $G$  by applying the inference rules a finite number of times.

# An entailment regime for RDFS in SPARQL 1.1

Basic graph patterns are evaluated by considering RDFS entailment.

## Definition

The evaluation of a bgp  $P$  over an RDF graph  $G$ , denoted by  $\llbracket P \rrbracket_G$ , is the set of mappings  $\mu$ :

- ▶  $\text{dom}(\mu) = \text{var}(P)$
- ▶ there exists an instance mapping  $\sigma$  such that **for every**  $t \in P$ :  
 $G \models \mu(\sigma(t))$

# An entailment regime for RDFS in SPARQL 1.1

Basic graph patterns are evaluated by considering RDFS entailment.

## Definition

The evaluation of a bgp  $P$  over an RDF graph  $G$ , denoted by  $\llbracket P \rrbracket_G$ , is the set of mappings  $\mu$ :

- ▶  $\text{dom}(\mu) = \text{var}(P)$
- ▶ there exists an instance mapping  $\sigma$  such that **for every  $t \in P$ :**  
 **$G \models \mu(\sigma(t))$**

The semantics of AND, UNION, OPT, FILTER and SELECT are defined as before.

- ▶ RDFS entailment is only used at the level of bgps

# Entailment regimes in SPARQL 1.1: Some observations

- ▶ SPARQL 1.1 can be used to query not only data but also schema information
  - ▶ For example: `(?X, rdfs:sc, person)`

# Entailment regimes in SPARQL 1.1: Some observations

- ▶ SPARQL 1.1 can be used to query not only data but also schema information
  - ▶ For example:  $(?X, \text{rdfs:sc}, \text{person})$
- ▶ Basic graph patterns can also be evaluated by considering OWL entailment.
  - ▶  $G \models \mu(\sigma(t))$  has to be defined according to the semantics of OWL

# Entailment regimes in SPARQL 1.1: Some observations (cont'd)

- What are the consequences of considering entailment only at the level bgps?

## Example

Let  $G$  be a graph consisting of  $(\text{john}, \text{rdfs:type}, \text{student})$  together with:

$$\left. \begin{array}{l} (\text{student}, \text{rdfs:sc}, u) \\ (u, \text{owl:union}, l) \\ (l, \text{rdf:first}, \text{undergrad}) \\ (l, \text{rdf:rest}, r) \\ (r, \text{rdf:first}, \text{grad}) \\ (r, \text{rdf:rest}, \text{rdf:nil}) \end{array} \right\} \text{ axiom } \text{student} \sqsubseteq (\text{undergrad} \sqcup \text{grad})$$

What should be the answer to

$P = ((?X, \text{rdfs:type}, \text{undergrad}) \text{ UNION } (?X, \text{rdfs:type}, \text{grad}))?$

- Under the current semantics:  $\llbracket P \rrbracket_G = \emptyset$

## Entailment regimes in SPARQL 1.1: Some observations (cont'd)

- ▶ It is possible to define a certain-answers semantics for SPARQL 1.1.
  - ▶ Previous example shows that this semantics does not coincide with the official semantics of SPARQL 1.1

## Entailment regimes in SPARQL 1.1: Some observations (cont'd)

- ▶ It is possible to define a certain-answers semantics for SPARQL 1.1.
  - ▶ Previous example shows that this semantics does not coincide with the official semantics of SPARQL 1.1

But what happens if we focus on the case of RDFS?

- ▶ The semantics do not coincide as the following operator can be expressed in the language:

$$\llbracket (P_1 \text{ MINUS } P_2) \rrbracket_G = \llbracket P_1 \rrbracket_G \setminus \llbracket P_2 \rrbracket_G$$

# Entailment regimes in SPARQL 1.1: Some observations (cont'd)

- ▶ It is possible to define a certain-answers semantics for SPARQL 1.1.
  - ▶ Previous example shows that this semantics does not coincide with the official semantics of SPARQL 1.1

But what happens if we focus on the case of RDFS?

- ▶ The semantics do not coincide as the following operator can be expressed in the language:

$$\llbracket (P_1 \text{ MINUS } P_2) \rrbracket_G = \llbracket P_1 \rrbracket_G \setminus \llbracket P_2 \rrbracket_G$$

## Open issues

- ▶ How natural is the semantics of SPARQL 1.1? Is it a good semantics? Why?
- ▶ Under which (natural) restrictions these two semantics coincide?

# Outline of the talk

- ▶ RDF and SPARQL

# Property paths in SPARQL 1.1

New element in SPARQL 1.1: A triple of the form  $(x, \textit{exp}, y)$

- ▶ *exp* is a property path
- ▶  $x$  (resp.  $y$ ) is either an element from  $\mathbf{I}$  or a variable

# Property paths in SPARQL 1.1

New element in SPARQL 1.1: A triple of the form  $(x, \textit{exp}, y)$

- ▶  $\textit{exp}$  is a property path
- ▶  $x$  (resp.  $y$ ) is either an element from  $\mathbf{I}$  or a variable

## Example

- ▶  $(?X, (\textit{rdfs:sc})^*, \textit{person})$ : Verifies whether the value stored in  $?X$  is a subclass of  $\textit{person}$
- ▶  $(?X, (\textit{rdfs:sp})^*, ?Y)$ : Verifies whether the value stored in  $?X$  is a subproperty of the value stored in  $?Y$

# Semantics of property paths

Evaluation of  $t = (?X, \text{exp}, ?Y)$  over an RDF graph  $G$  is the set of mappings  $\mu$  such that:

# Semantics of property paths

Evaluation of  $t = (?X, exp, ?Y)$  over an RDF graph  $G$  is the set of mappings  $\mu$  such that:

- ▶ The domain of  $\mu$  is  $\{?X, ?Y\}$ , and
- ▶  $(\mu(?X), \mu(?Y)) \in \llbracket exp \rrbracket_G$

# Semantics of property paths

Evaluation of  $t = (?X, \text{exp}, ?Y)$  over an RDF graph  $G$  is the set of mappings  $\mu$  such that:

- ▶ The domain of  $\mu$  is  $\{?X, ?Y\}$ , and
- ▶  $(\mu(?X), \mu(?Y)) \in \llbracket \text{exp} \rrbracket_G$

Other cases are defined analogously.

# Semantics of property paths

Evaluation of  $t = (?X, exp, ?Y)$  over an RDF graph  $G$  is the set of mappings  $\mu$  such that:

- ▶ The domain of  $\mu$  is  $\{?X, ?Y\}$ , and
- ▶  $(\mu(?X), \mu(?Y)) \in \llbracket exp \rrbracket_G$

Other cases are defined analogously.

## Example

- ▶  $((?X, KLM/(KLM)^*, ?Y) \text{ FILTER } \neg(?X = ?Y))$ : It is possible to go from  $?X$  to  $?Y$  by using the airline KLM, where  $?X, ?Y$  are different cities

# SPARQL 1.1: Entailment regimes and property paths

List the pairs  $a, b$  of cities such that there is a way to travel from  $a$  to  $b$ .

# SPARQL 1.1: Entailment regimes and property paths

List the pairs  $a, b$  of cities such that there is a way to travel from  $a$  to  $b$ .

In SPARQL 1.1:  $(?X, \text{transportation\_service}^*, ?Y)$

# Navigational capabilities in SPARQL 1.1: Some observations

- ▶ Previous query can be expressed in SPARQL 1.1 as the intermediate form of navigation involves RDFS vocabulary.

Not expressible: List pairs  $a$ ,  $b$  of persons that are connected through a path of nodes certified by certifying\_agency [RK13]:

## Navigational capabilities in SPARQL 1.1: Some observations (cont'd)

- ▶ Some proposals solve the aforementioned issues: nSPARQL [PAG10], nested monadically defined queries [RK13], triple algebra [LRV13]
  - ▶ RDFS entailment can be handled in these proposals by using navigational capabilities

# Navigational capabilities in SPARQL 1.1: Some observations (cont'd)

- ▶ Some proposals solve the aforementioned issues: nSPARQL [PAG10], nested monadically defined queries [RK13], triple algebra [LRV13]
  - ▶ RDFS entailment can be handled in these proposals by using navigational capabilities

## Open issues

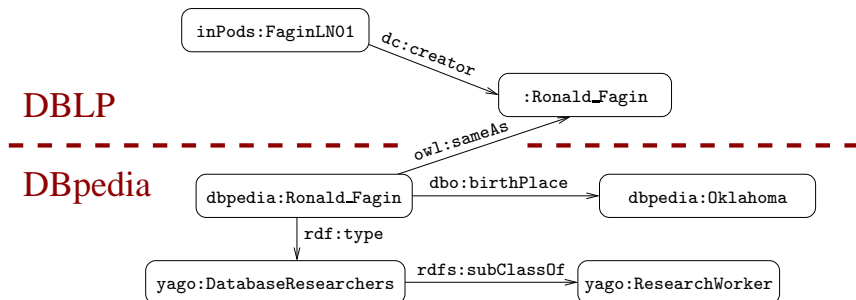

- ▶ How can OWL entailment be handled in these proposals?
- ▶ What navigational capabilities should be added to SPARQL 1.1?
- ▶ There is a need for query languages that can return paths

# Outline of the talk

- ▶ RDF and SPARQL

# Federation in SPARQL 1.1

New rule to generate graph patterns:

- ▶ If  $P$  is a graph pattern and  $c \in (\mathbf{I} \cup \mathbf{V})$ , then  $(\text{SERVICE } c \ P)$  is a graph pattern.

# Federation in SPARQL 1.1

New rule to generate graph patterns:

- ▶ If  $P$  is a graph pattern and  $c \in (\mathbf{I} \cup \mathbf{V})$ , then  $(\text{SERVICE } c \ P)$  is a graph pattern.

We will define the semantics of this new operator.

- ▶ This corresponds with the official semantics for  $(\text{SERVICE } c \ P)$  with  $c \in \mathbf{I}$
- ▶  $(\text{SERVICE } ?X \ P)$  is allowed in the official specification of SPARQL 1.1, but its semantics is not defined

# Semantics of SERVICE

$ep(\cdot)$ : Partial function from **I** to the set of all RDF graphs

- ▶ If  $c \in \text{dom}(ep)$ , then  $ep(c)$  is the RDF graph associated with the endpoint accessible via  $c$

# Semantics of SERVICE

$\text{ep}(\cdot)$ : Partial function from  $\mathbf{I}$  to the set of all RDF graphs

- ▶ If  $c \in \text{dom}(\text{ep})$ , then  $\text{ep}(c)$  is the RDF graph associated with the endpoint accessible via  $c$

## Definition (BACP13)

The evaluation of  $P = (\text{SERVICE } c P_1)$  over an RDF graph  $G$  is defined as:

- ▶ if  $c \in \text{dom}(\text{ep})$ , then  $\llbracket P \rrbracket_G = \llbracket P_1 \rrbracket_{\text{ep}(c)}$
- ▶ if  $c \in \mathbf{I} \setminus \text{dom}(\text{ep})$ , then  $\llbracket P \rrbracket_G = \{\mu_\emptyset\}$  (where  $\mu_\emptyset$  is the mapping with empty domain)
- ▶ if  $c \in \mathbf{V}$ , then

$$\llbracket P \rrbracket_G = \bigcup_{a \in \text{dom}(\text{ep})} \left( \llbracket P_1 \rrbracket_{\text{ep}(a)} \bowtie \{\mu_{c \rightarrow a}\} \right),$$

where  $\mu_{c \rightarrow a}$  is a mapping such that  $\text{dom}(\mu_{c \rightarrow a}) = \{c\}$  and  $\mu_{c \rightarrow a}(c) = a$

# Are variables useful in SERVICE queries?

Consider the query:

$(?X, \text{service\_address}, ?Y) \text{ AND } (\text{SERVICE } ?Y (?N, \text{email}, ?E))$

# Are variables useful in SERVICE queries?

Consider the query:

$(?X, \text{service\_address}, ?Y) \text{ AND } (\text{SERVICE } ?Y (?N, \text{email}, ?E))$

There is a simple strategy to compute the answer to this query.

- ▶ Can this strategy be generalized?

# How can we evaluate SERVICE queries?

We need some notion of boundedness

- ▶ A variable  $?X$  is **bound** in a graph pattern  $P$  if for every RDF graph  $G$  and every  $\mu \in \llbracket P \rrbracket_G$ , it holds that  $?X \in \text{dom}(\mu)$  and  $\mu(?X)$  is mentioned in  $G$

First attempt: Graph pattern  $P$  can be evaluated if for every sub-pattern  $(\text{SERVICE } ?X \ P_1)$  of  $P$ , it holds that  $?X$  is bound in  $P$

- ▶  $?Y$  is bound in  
( $?X, \text{service\_address}, ?Y$ ) AND ( $\text{SERVICE } ?Y \ (?N, \text{email}, ?E)$ )

# The first attempt: Too restrictive

Consider the query:

$(?X, \text{service\_description}, ?Z) \text{ UNION } \left( (?X, \text{service\_address}, ?Y) \text{ AND } (\text{SERVICE } ?Y (?N, \text{email}, ?E)) \right)$

$?Y$  is not bound in this query, but there is a simple strategy to evaluate it.

# The first attempt: Not appropriate for nested SERVICE operators

Consider the query:

$$(?U_1, \text{related\_with}, ?U_2) \text{ AND } \left[ \text{SERVICE } ?U_1 \left( (?N, \text{email}, ?E) \text{ OPT } \left( \text{SERVICE } ?U_2 (?N, \text{phone}, ?F) \right) \right) \right]$$

# Solving the problems ...

Notation:  $\mathcal{T}(P)$  is the *parse tree* of  $P$ , in which every node corresponds to a sub-pattern of  $P$

Parse tree of  $(?Y, a, ?Z) \text{ UNION } ((?X, b, c) \text{ AND } (\text{SERVICE } ?X (?Y, a, ?Z)))$ :

# A more appropriate notion of boundedness

## Definition (BACP13)

A graph pattern  $P$  is service-bound if for every node  $u$  of  $\mathcal{T}(P)$  with label  $(\text{SERVICE } ?X \ P_1)$ , it holds that:

- ▶ there exists a node  $v$  of  $\mathcal{T}(P)$  with label  $P_2$  such that  $v$  is an ancestor of  $u$  in  $\mathcal{T}(P)$  and  $?X$  is bound in  $P_2$
- ▶  $P_1$  is service-bound

# A more appropriate notion of boundedness

## Definition (BACP13)

A graph pattern  $P$  is service-bound if for every node  $u$  of  $\mathcal{T}(P)$  with label  $(\text{SERVICE } ?X P_1)$ , it holds that:

- ▶ there exists a node  $v$  of  $\mathcal{T}(P)$  with label  $P_2$  such that  $v$  is an ancestor of  $u$  in  $\mathcal{T}(P)$  and  $?X$  is bound in  $P_2$
- ▶  $P_1$  is service-bound

Examples:

# A more appropriate notion of boundedness

## Definition (BACP13)

A graph pattern  $P$  is service-bound if for every node  $u$  of  $\mathcal{T}(P)$  with label  $(\text{SERVICE } ?X P_1)$ , it holds that:

- ▶ there exists a node  $v$  of  $\mathcal{T}(P)$  with label  $P_2$  such that  $v$  is an ancestor of  $u$  in  $\mathcal{T}(P)$  and  $?X$  is bound in  $P_2$
- ▶  $P_1$  is service-bound

Examples:

# A more appropriate notion of boundedness

## Definition (BACP13)

A graph pattern  $P$  is service-bound if for every node  $u$  of  $\mathcal{T}(P)$  with label  $(\text{SERVICE } ?X P_1)$ , it holds that:

- ▶ there exists a node  $v$  of  $\mathcal{T}(P)$  with label  $P_2$  such that  $v$  is an ancestor of  $u$  in  $\mathcal{T}(P)$  and  $?X$  is bound in  $P_2$
- ▶  $P_1$  is service-bound

Examples:

# A more appropriate notion of boundedness

## Definition (BACP13)

A graph pattern  $P$  is service-bound if for every node  $u$  of  $\mathcal{T}(P)$  with label (SERVICE ?X  $P_1$ ), it holds that:

- ▶ there exists a node  $v$  of  $\mathcal{T}(P)$  with label  $P_2$  such that  $v$  is an ancestor of  $u$  in  $\mathcal{T}(P)$  and ?X is bound in  $P_2$
- ▶  $P_1$  is service-bound

Examples:

(?Y, a, ?Z)

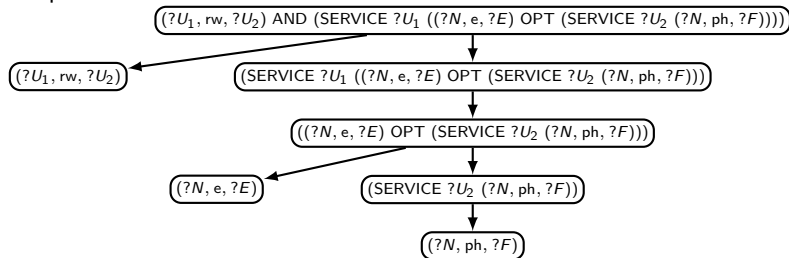

# A more appropriate notion of boundedness

## Definition (BACP13)

A graph pattern  $P$  is service-bound if for every node  $u$  of  $\mathcal{T}(P)$  with label  $(\text{SERVICE } ?X P_1)$ , it holds that:

- ▶ there exists a node  $v$  of  $\mathcal{T}(P)$  with label  $P_2$  such that  $v$  is an ancestor of  $u$  in  $\mathcal{T}(P)$  and  $?X$  is bound in  $P_2$
- ▶  $P_1$  is service-bound

Examples:

# A more appropriate notion of boundedness

## Definition (BACP13)

A graph pattern  $P$  is service-bound if for every node  $u$  of  $\mathcal{T}(P)$  with label  $(\text{SERVICE } ?X P_1)$ , it holds that:

- ▶ there exists a node  $v$  of  $\mathcal{T}(P)$  with label  $P_2$  such that  $v$  is an ancestor of  $u$  in  $\mathcal{T}(P)$  and  $?X$  is bound in  $P_2$
- ▶  $P_1$  is service-bound

Examples:

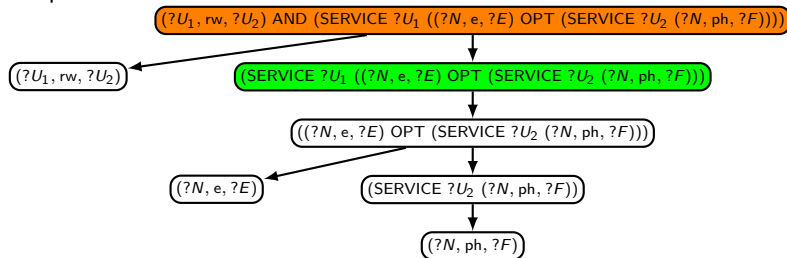

# A more appropriate notion of boundedness

## Definition (BACP13)

A graph pattern  $P$  is service-bound if for every node  $u$  of  $\mathcal{T}(P)$  with label  $(\text{SERVICE } ?X \ P_1)$ , it holds that:

- ▶ there exists a node  $v$  of  $\mathcal{T}(P)$  with label  $P_2$  such that  $v$  is an ancestor of  $u$  in  $\mathcal{T}(P)$  and  $?X$  is bound in  $P_2$
- ▶  $P_1$  is service-bound

Examples:

# A more appropriate notion of boundedness

## Definition (BACP13)

A graph pattern  $P$  is service-bound if for every node  $u$  of  $\mathcal{T}(P)$  with label  $(\text{SERVICE } ?X \ P_1)$ , it holds that:

- ▶ there exists a node  $v$  of  $\mathcal{T}(P)$  with label  $P_2$  such that  $v$  is an ancestor of  $u$  in  $\mathcal{T}(P)$  and  $?X$  is bound in  $P_2$
- ▶  $P_1$  is service-bound

Examples:

# A more appropriate notion of boundedness

## Definition (BACP13)

A graph pattern  $P$  is service-bound if for every node  $u$  of  $\mathcal{T}(P)$  with label  $(\text{SERVICE } ?X P_1)$ , it holds that:

- ▶ there exists a node  $v$  of  $\mathcal{T}(P)$  with label  $P_2$  such that  $v$  is an ancestor of  $u$  in  $\mathcal{T}(P)$  and  $?X$  is bound in  $P_2$
- ▶  $P_1$  is service-bound

Examples:

# A more appropriate notion of boundedness (cont'd)

But we still have a problem:

## Proposition (BACP13)

*The problem of verifying, given a graph pattern  $P$ , whether  $P$  is service-bound is undecidable.*

We consider a (syntactic) sufficient condition for service-boundedness.

# An appropriate notion: Service-safeness

The set of strongly bound variables in  $P$ , denoted by  $SB(P)$ , is recursively defined as follows:

- ▶ if  $P$  is a bgp, then  $SB(P) = \text{var}(P)$
- ▶ if  $P = (P_1 \text{ AND } P_2)$ , then  $SB(P) = SB(P_1) \cup SB(P_2)$
- ▶ if  $P = (P_1 \text{ UNION } P_2)$ , then  $SB(P) = SB(P_1) \cap SB(P_2)$
- ▶ if  $P = (P_1 \text{ OPT } P_2)$ , then  $SB(P) = SB(P_1)$
- ▶ if  $P = (P_1 \text{ FILTER } R)$ , then  $SB(P) = SB(P_1)$
- ▶ if  $P = (\text{SERVICE } c \ P_1)$ , then  $SB(P) = \emptyset$

# An appropriate notion: Service-safeness (cont'd)

## Definition (BACP13)

A graph pattern  $P$  is **service-safe** if for every node  $u$  of  $\mathcal{T}(P)$  with label  $(\text{SERVICE } ?X \ P_1)$ , it holds that:

- ▶ there exists a node  $v$  of  $\mathcal{T}(P)$  with label  $P_2$  such that  $v$  is an ancestor of  $u$  in  $\mathcal{T}(P)$  and  $?X \in \text{SB}(P_2)$
- ▶  $P_1$  is **service-safe**

If  $P$  is service-safe, then there is a strategy to evaluate  $P$  without considering all possible SPARQL endpoints.

# An appropriate notion: Service-safeness (cont'd)

## Definition (BACP13)

A graph pattern  $P$  is **service-safe** if for every node  $u$  of  $\mathcal{T}(P)$  with label  $(\text{SERVICE } ?X \ P_1)$ , it holds that:

- ▶ there exists a node  $v$  of  $\mathcal{T}(P)$  with label  $P_2$  such that  $v$  is an ancestor of  $u$  in  $\mathcal{T}(P)$  and  $?X \in \text{SB}(P_2)$
- ▶  $P_1$  is **service-safe**

If  $P$  is service-safe, then there is a strategy to evaluate  $P$  without considering all possible SPARQL endpoints.

## Open issue

Is service-safeness the right condition to ensure that a query containing the SERVICE operator can be executed? Why?

# Outline of the talk

- ▶ RDF and SPARQL
